

# *Applied Scaling & Classification Techniques in Political Science*

Fifth Assignment

# Deadline: 20 January 2023

Run any query you like on Twitter

Run a semi-supervised classification via `newsmap` on it by identifying the seed words you think are relevant given your query

Replicate the analysis by employing *keyATM* while employing as a covariate the day in which a tweet has been published. To make things easier, just create a temporal dummy: 1=today published tweets; 0=earlier than today published tweets

Comment the results

Do you find any significant difference between tweets published in different days in terms of the salience given to the different topics?

Do you find any difference between tweets published in different days in terms of the words employed for the different topics?
